An Eating Disorder is a psychological condition that shows itself in unhealthy and extreme eating habits. There are four types of eating disorders that are characterized by specific behaviors. Two primary behaviors are binge-eating, the consumption of a large amount of food in a short period of time accompanied by feelings of loss of control, and purging or self-induced vomiting. Misuse of laxatives, diet pills, or water pills, or intense excessive exercising after binging are also considered purging.

**Types of Eating Disorders**

**Bulimia Nervosa** is the most common of the four diagnoses. It is characterized by preoccupation with food and weight, binging and a compensation for binging by purging, excessive exercise or fasting. This pattern is accompanied by shame and secrecy. Individuals with Bulimia Nervosa cannot be identified on the basis of weight—many are normal weight or even overweight.

**Anorexia Nervosa** is characterized by a refusal to maintain a normal weight for one’s height, body type, age and activity level; restriction of food intake due to an intense fear of becoming “fat” or gaining weight (extreme concern over one’s weight); body image misperception and loss of two consecutive menstrual periods in females.

**Binge-eating Disorder** is characterized by binging, feelings of shame and self-hatred associated with binging, but not accompanied by purging.

**Eating Disorders Not Otherwise Specified** covers all maladaptive eating behaviors that do not fit into the above diagnoses. Examples include: restricting food intake, meeting some but not all of the requirements for the above diagnoses, chewing food and spitting it out, or binging and purging irregularly.

**Children with an eating disorder may experience:**

Physical problems (many that can be life-threatening) such as:
- Excessive weight loss
- Irregular or absence of menstruation in females
- Hair loss
- Severe digestive system problems
- Damaged vital organs
- Tooth and gum problems
- Swollen salivary glands due to induced vomiting
- General malnutrition
- Dehydration
- Thinning of the bones resulting in osteoporosis or osteopenia

Emotional issues such as:
- Low-self-esteem and a poor body image
- Being prone to mood swings, perfectionism and depression
- Strained relationships with family and friends
- Performing poorly in academic situations
- Suffering from other psychiatric disorders such as depression, anxiety, alcohol and drug dependencies

**How it affects my child**

Of the currently more than 10 million Americans afflicted with eating disorders, 90 percent are children and adolescents.

- The average age of eating disorder onset has dropped from 13-17 to 9-12.
- The number of males with eating disorders has doubled during the past decade.

**What can we do about it?**

**Build children’s self-esteem based on their positive traits.** Be as supportive and encouraging as you can in raising children. Also, always try to highlight the positive points of their personalities and praise them for their good behaviors. Do not expect them to be perfect.

**Serve as a healthy role model for your children.** Do not diet. The key to developing a healthy lifestyle is to practice moderation both in eating and exercising.
The Children's Mental Health Matters! Campaign is a collaboration of the Mental Health Association of Maryland (MHAMD) and the Maryland Coalition of Families (MCF) with support from the Maryland Department of Health - Behavioral Health Administration. The Campaign goal, with School and Community Champions across the state, is to raise public awareness of the importance of children's mental health. For more information, please visit www.ChildrensMentalHealthMatters.org

Construct a healthy relationship with food. Make meal time a fun time by gathering all family members together and enjoying a variety of healthy foods. Never turn meal time into a power struggle between you and your child by rewarding or punishing him/her for his/her behavior with food.

Teach your children to respect differences in body structure and feel good about their appearances. Avoid labeling your children regarding weight and commenting about other people’s weight and appearance as an indicator of their character and personality. Not all people resemble thin models and movie stars, so you should teach children that everyone is born with a unique body shape which is mostly influenced by family history. Encourage a realistic and positive body image.

Watch for warning signs. If you notice a change in your child’s dietary behavior, such as anxiety around meal time, avoidance of social situations involving food, food rituals, visiting the bathroom soon after meals, rapid fluctuation in weight, overeating or hoarding, it is a good idea to seek the advice of a mental health professional.

Taking care of yourself. A battle with an eating disorder can be long and difficult, especially for parents. Do not blame yourself. If you begin to feel overwhelmed, it is wise to seek professional help. Remember, you cannot help your child without being healthy yourself.
